Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

## ALIGNMENTS

HE SUPPLIES OF SUP DNA encoding TNF binding protein and TNF- receptor - used in tumour treatment and to understand mechanismsm to TNF action Disclosure; Fig 1(1-3); 51pp; German.

S Disclosure; Fig 1(1-3); 51pp; German.

C pTNF-BP15 is one of 30 positives clones in a screened cDNA library from induced TNF-induced fibrosarcoma cells. A TNF-BP had been isolated from the urine of patients with uraemia and probes/primers were constructed from the determined amino acid sequence.

To produce a vector expressing a soluble form of TNF-binding protein, this plasmid was cut with Xmm1, amplified by PCR and the amplified DNA cut with Banmil and EcoRI.

The resulting 0.75 kb DNA fragment was inserted into pT7/T3 alpha-19 (BRL) cut with Banme enzymes to recover pTNF-BP. This was cut with Banmil and EcoRI, and the recovered fragment inserted into pAD-CMV1 (Q06283) to give the required plasmid pADTNF-BP.

DE Encodes TNF-alpha 55kD receptor.

E tumour necrosis factor alpha; extracellular binding domain;

KW treatment; pulmonary diseases; septic shock; HIV infection;

KW malaria; viral meningits; graft versus host disease;

KW autoimmune disease; rheumatoid arthritis.

CS Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The linker may comprise 5-100 amino acids selected from Gly, Asp, Ser, Thr and Ala. These linkers separate the individual moeities by such a distance that each component of the fusion protien is capable of folding into the secondary or tertiary structure required for its biological activity. These fusion proteins may be used in therapy, diagnosis and assays for conditions mediated by TNF or II-1, particularly in conditions in which both TNF and II-1 play a causitive role. They may be used to treat cachaxia, rheumatoid arthritis, diabetes, multiple sclerosis, pulmonary fibrosis and silicosis, cerebral malaria, allograft and xenograft rejection in graft verses host disease, sepsis, septic shock, inflammation, allergies and autoimmune dysfunctions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in Q49931-32 encode human tumour necrosis receptor (TMF-R) and the sequences in Q4993-34 encode human interleukin-1 receptor (II-IR). These sequences were used in production of a fusion protein which conformed to one of the formulae:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TNF-R-linker-TNF-R-linker-IL-1R

first three cysteine-rich subdomains of TNF alpha receptor for

treating autoimmune disease, septic shock, HIV etc.

Claim 4; Fig 1; 43pp; English.

This sequence encodes human TNF-alpha 55kD receptor . A placenta cDNA

Library in gt10 was screened with probe Q29236. Ten hybridising clones

were plaque purified and cDNA size determined by PAGE against an

Eco RI digested phage DNA. The inserts of two cDNA clones were then

sequenced. The coding region of the majority of the human TNF-alpha

SkD receptor was isolated as an EcoRI fragment encoding 374 amino

Cacids, and cloned into a mammalian cell expression vector, resulting

in prNFR. A derivative of the TNF-alpha receptor was produced by

censineering a termination codon just prior to the transmembrane

commain. PCR with primers Q29237,8 generated a 300bp

restriction fragment which was cloned into prTNFR, giving pTNFRecd.

DNA sequencing confirmed this contained the designed DNA sequence.

The TNF-alpha receptor expression plasmids were then transfected

sensets Confirmed this contained the designed DNA sequence.

Disclosure; Fig 1; 25pp; English.
The sequence is that of DNA encoding tumour necrosis factor alpha binding protein which was obtd. from a human placental cDNA library in lambda gtl1 using a probe (Q20974). The DNA also encodes the extracellular domain of human TNF alpha receptor and as such it is useful for treating diseases where TNF alpha is involved as a causative agent, e.g. cachexia, sepsis and autoimmune diseases, specifically rheumatoid arthritis. See also Q20974.

PT Tumour necrosis factor inhibitor - for suppression of TNF-alpha P-PSDB; R10986.
PT Tumour becas, useful as therapeutic agent.
PT and -beta, useful as therapeutic agent.
PT the sequence was obtd. was isolated from a cDNA library and composition of TNF whole CC prepci. from RNA form U937 cells treated with PMA/PHA. The whole CC inhibitor for use in the treatment of inflammatory and degenerative

Claim 4; Fig 1; 26pp; German.
Claim 4; Fig 1; 26pp; German.
Partial amino acid sequences were determined for the 55 and 75kD
Partial amino acid sequences were determined primers were
synthesised based on these partial sequences. The primers were used
to produce a cDNA fragment for use as aprobe to screen a human
placental cDNA bank constructed in lambda gtll. Positive clones were
identified and sequenced. DNA constructs comprising the TNT-BP coding
sequence may also contain a fragment encoding a human Ig domain.
Recombinant constructs are used to transform cells to confer
improved TNF-binding properties.

PT New protease capable of cleaving soluble tumour necrosis factor PT (TNF) receptor - from cell-bound TNF- receptor, useful for antagonising deleterious effects of TNF.

PT antagonising deleterious effects of TNF.

CC Expression of this receptor is regulated by shedding of the extracellular receptor fragment. The p55 TNF-R can be shed in response to different candiding agents, e.g. phorbol myristate acetate (PMA), depending on cell canding agents, e.g. phorbol myristate acetate (PMA), depending on cell candiding response is the spacer region (see RF5012) in the extracellular commain. This region is located close to a site of cleavage of the collecule, and links the Cys rich module to the transmembrane domain. The spacer region of the encoded protein was used to create the chimeras complete that are represented by R75007-11. This spacer region was subjected to deletion mutations (R75013-25) and substitutions

Of the spacer region, the most important residues are Asn 172, Val 173, Lys 174 and Gly 175, with Val 173 being the most important of these. The shedding of the receptor is independent of the side chain identity of these residues, with the exception of a limited dependence on the identity of Val 173. Mutations which alter the conformation of the protein adversely effect the shedding process. The mutations shown in R75013-47 were introduced in order to create an inhibitor of a protease that is capable of cleaving the soluble TNF-R from the cell bound TNF-R. Fragments of these inhibitors can be seen 1 R75017-9, R75025, R75033-5 and R75042-3. These protease inhibitors can be used for enhancing TNF function.
Improved process for the expressing high level of cells contg. a DNA constr

A dicistronic vector (715930) comprises a regulatory region derived from the cytomegalovirus immediate-early gene, a selectable dihydrofolate reductase gene positioned within an intron having a 5' wild-type ras splice donor site, a downstream sequence coding for an immunoadhesin, TnFr-IgG, capable of binding tumour necrosis factor, and a poly-A sequence. Transfection of CHO DHFR- cells and subsequent methotrexate amplification and growth of the cells in nutrient-rich medium gave TnFr-IgG in yields of 9.5 ug/ml (15-fold higher compared to conventional vector amplified

raTNF-R8 (Q06284) was used to screen the HS913T cDNA 11
LambdaTNF-R2 encodes the complete human TNF-R2 and was construct a plasmid (pADTNF-R) expressing the product t as pADTNF-BP (see Q06282).

                                                                                                                                                                                                                                      Recombinant tumour necrosis factor binding protein I - prepd. by transfecting eukaryotic cells with vector contg. deoxyribonucleic acid encoding human type T TNF receptor or soluble domain Disclosure; Fig 1(D); 30pp; English.

The Tumour Necrosis Factor Binding Protein I is the soluble form of type I TNF-receptor and constitutes a fragment of the cell surface form of this receptor, corresp. to its extracellular domain. There is no characteristic poly(A) addition signal near the 3' end of the cDNA. The sequence ACTAAA (tag m) may serve as an alternative to this signal, but with low efficiency.
                                                                                                                                                                                                                              of the cDNA. The sequence A alternative to this signal, See also Q12212-15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /+tag= h

Claim 2; Figure 1; 17pp; English.

Modification of the tumour necrosis factor receptor by mutation deletion modulates signal transduction and/or cleavage effected the receptor. This modulation of activity can also be achieved using effector proteins which interact with the TNF receptor.

Molecules which interact with the TNF receptor or the effector proteins can be used to treat or prevent diseases associated wit TNF activity e.g. autoimmune disease; rheumatoid arthritis; graft rejection; graft vs. host disease or septic shock. They can also be used to treat overdoses of exogenous TNF.

Example: Fig 7; 43pp; English.

This sequence encodes the designed TNF-alpha 55kD receptor derivative, as present in purfeced. This was produced as described 024441. This derivative lacks the 81 carboxyl terminal residues of the cytoplasmic domain. The derivative could be used in the regulation of TNF-alpha mediated responses by binding and sequestering human TNF-alpha eg. in the treatment of pulmonary diseases, septic shock, HIV infection, malaria, viral meningitis, graft versus host disease and autoimmune diseases, esp. rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Encodes truncated TNF-alpha 55kD receptor (197 amino acids). tumour necrosis factor alpha; extracellular binding domain; treatment; pulmonary diseases; septic shock; HIV infection; malaria; viral meningits; graft versus host disease; autoimmune disease; rheumatoid arthritis.

                                              New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

Example 3; Fig 4a; 94pp; English.

The sequence is an analogue of hCG beta subunit cDNA contg. two silent mutations which eliminate restriction sites. It was prepd. from the plasmid pRMB-hCG-beta, a construct contg. the hCG beta subunit isolated from human placenta (Fiddes and Goodman) in plasmid pRMB, a derivative of pCCB designed to facilitate cloning of glycoprotein hormones. The sequence was used as the starting construct for many mutants. (See R15061-R15125 and R15161-R15198). Sequence 579 BP; 128 A; 205 C; 151 G; 95 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     11-FEB-1992 (first entry)

Methods for altering fertility in mammals, esp. humans - e.g. Methods for altering fertility by reducing the activity and/or levels of stimulating fertility by reducing the activity and/or levels of circulating glyco:protein hormones having lutropin activity Example 12; Fig 6; 102pp; English.

Analogue 1 (human CG-beta(1-145)-linker-human CG-alpha(1-92)) is a specific example of a single chain gonadotropin having a chorionic gonadotropin (CG) beta-subunit at the N-terminus and a CG alpha-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        26-APR-1996 (first entry)

Reproper Repropersion of the activity and/or levels of stimulating fertility by reducing the activity and/or levels of stimulating fertility by reducing the activity and/or levels of circulating glyco:protein hormones having lutropin activity example 23; Fig 18: 102pp; English.

Analogue la (human CG-beta(1-145)-linker-human CG-alpha(1-92)(N530, CR80)) is a specific example of a single chain gonadotropin having a chorionic gonadotropin (CG) beta-subunit at the N-terminus and a CG alpha-subunit at the C-terminus, joined by a linker of 1-16 amino acids. The analogue la was derived from analogue 1 by removing the two glycosylation sites from the alpha-subunit. The analogue has anti-luteinising hormone (lutropin) activity and can be used for anti-luteinising hormone (lutropin) activity and reducing androgen secretion. The present sequence codes for analogue 1 a.

/note="Organ: mixed (see below); Vector: pT773D-Pac
/pharmacia) with a modified polylinker; Site_1: Not I;
Site_2: Eco RI; Equal amounts of plasmid DNA from three
normalized libraries (melanocyte 2NbHM, pregnant uterus
NbHPU, and fetal heart NbHH19W) were mixed, and ss circles
were made in vitro. Following HAP purification, this DNA
was used as tracer in a subtractive hybridization
reaction. The dilver was PCR-amplified cDNAs from pools of
5,000 clones made from the same 3 libraries. The pools
consisted of I.M.A.G.E. clones 26032-265223,
340488-345479, and 484488-489479."

/note="Organ: mixed (see below); Vector: pT773D-Pac
(Pharmacia) with a modified polylinker; Site_1: Not I;
Site_2: Eco RI; Equal amounts of plasmid DNA from three
normalized libraries (melanocyte 2NbHM, pregnant uterus
NbHPU, and fetal heart NbHHJW) were mixed, and ss circles
were made in vitro. Following HAP purification, this DNA
was used as tracer in a subtractive hybridization
reaction. The driver was PCR-amplified cDNAs from pools of
5,000 clones made from the same 3 libraries. The pools
consisted of I.M.A.G.E. clones 260232-265223,
340488-345479, and 484488-489479."

PF Hybrid dimeric protein comprising two co-expressed units - each per hybrid dimeric protein comprising subunit of a heterodimeric hased on receptor or ligand and a subunit of a heterodimeric per hormone, especially FSH, for inducing follicular maturation serious protein comprises 2 dimer forming co-expressed amino a rample; Pages 34-35; 60pp; English.

A novel fusion protein comprises 2 dimer forming co-expressed amino acid sequences, each consisting of a homodimeric or heterodimeric creceptor chain or ligand, with ligand-receptor binding activity, bound directly or via a peptide linker to a subunit of a cheterodimeric protein hormone capable of forming a heterodimer with the hormone's other subunits. The fusion protein, e.g. the the hormone's other subunits. The fusion protein, e.g. the check of the hormone's other subunits. The fusion protein, e.g. the chomopopeietin (TPO)/human chorionic gonadotrophin beta subunit (hGG-beta) fusion protein denoted by the present sequence, component, reducing the requirement for hormone itself and the cumber of injections needed.
